
5. Chatbot for Career Sites

< Back to Home

A year into joining Phenom, I was assigned to take up an entirely new product that was being conceptualised within our ecosystem - Chatbots. A basic feasibility check was done by then with the development team and there was a designer who initially researched about what are the possible approaches. My team was as follow.
My Responsibility - **UX lead**
Team members - **1 UX designer and 1 UI designer**

Problem

As a company, Phenoms core product is the personalised career sites. On the customers career sites, often the web traffic were not converted into leads as the contact details and name were not captured. **Only around 15% of the traffic were converted as leads.**

To solve this, we wanted a solution which seemed approachable, provides value and thus captures leads in the process.

This was also at a time where chatbot was in trend and there were many small startups offering chatbot as a solution.

Value proposition

We wanted the bot to be useful to our users and at the same time be a complimentary asset to the career site. We decided on the following to be chatbot core value proposition :-

1. **FAQs -** We know that users had questions about the customer about benefits, work culture, leadership etc. As an effort to maintain their branding as a candidate friendly company, recruiters need to respond to these candidate queries. In some cases, there were even call centres setup to answer these candidate queries. Our value proposition here was that we would answer all the commonly asked questions which are generic enough, thus saving the time, energy & costs involved in responding to candidate queries.

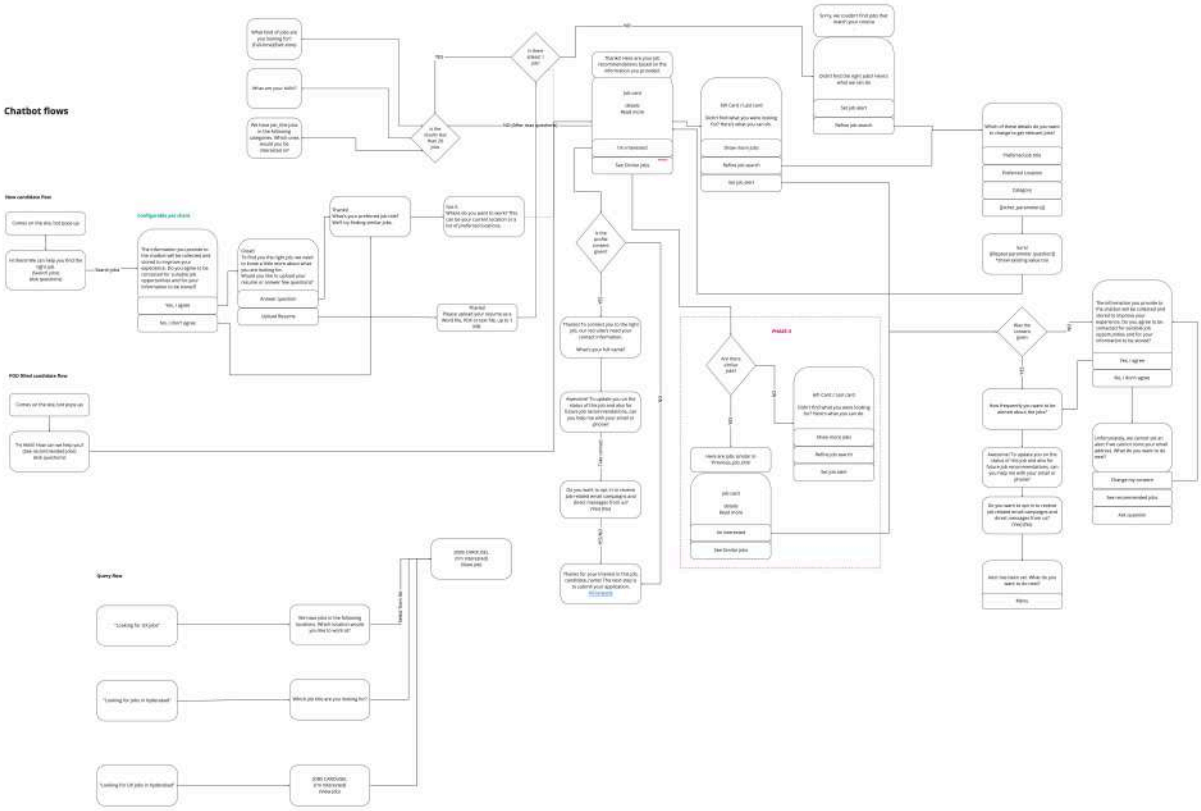
2. **Jobs -** The company's goal is to help a billion people find the right job via our customers. And we wanted to do so with minimal candidate information. For this reason, as soon as the user lands on the customers career site, we wanted to nudge them to give us the minimum required information to search for jobs and nudge them to apply. To provide them jobs as per the requirements back then, we asked candidates for job categories, preferred job title, location, years of experience and skills. Over a period of time, we cut this short as you will see in the 'Testing, iteration & learnings' section.
3. **Lead generation -** While we are providing a win-win for both the customer and the user is provide their personal details like name, email ID and phone number. This will ensure that the customer has a lead and has a way to contact the user.
4. **Similar jobs** - Based on the users interest, we also want to offer similar jobs by title and in different location, as a way to provide all possible options to the

users. These options come only if the most relevant results have been exhausted.

5. **Set up alerts -** Incases where the users don't find the relevant jobs, they can choose to set-up a job alert. So, in the future, whenever there are jobs relevant to users criteria, those can be sent out to users over email.

Flows

Based on the value proposition we wanted to offer, we created flows for the user to interact with the chatbot.



Inspirations

Design

Chatbot is a product i've been working on constantly, tweaking and improving based on data and insights we get. The designs shown below are from the most recent design.
Based on the inspirations and the flows we wanted to achieve, we made the designs in the following ways -

1. **Chatbot pop-up**

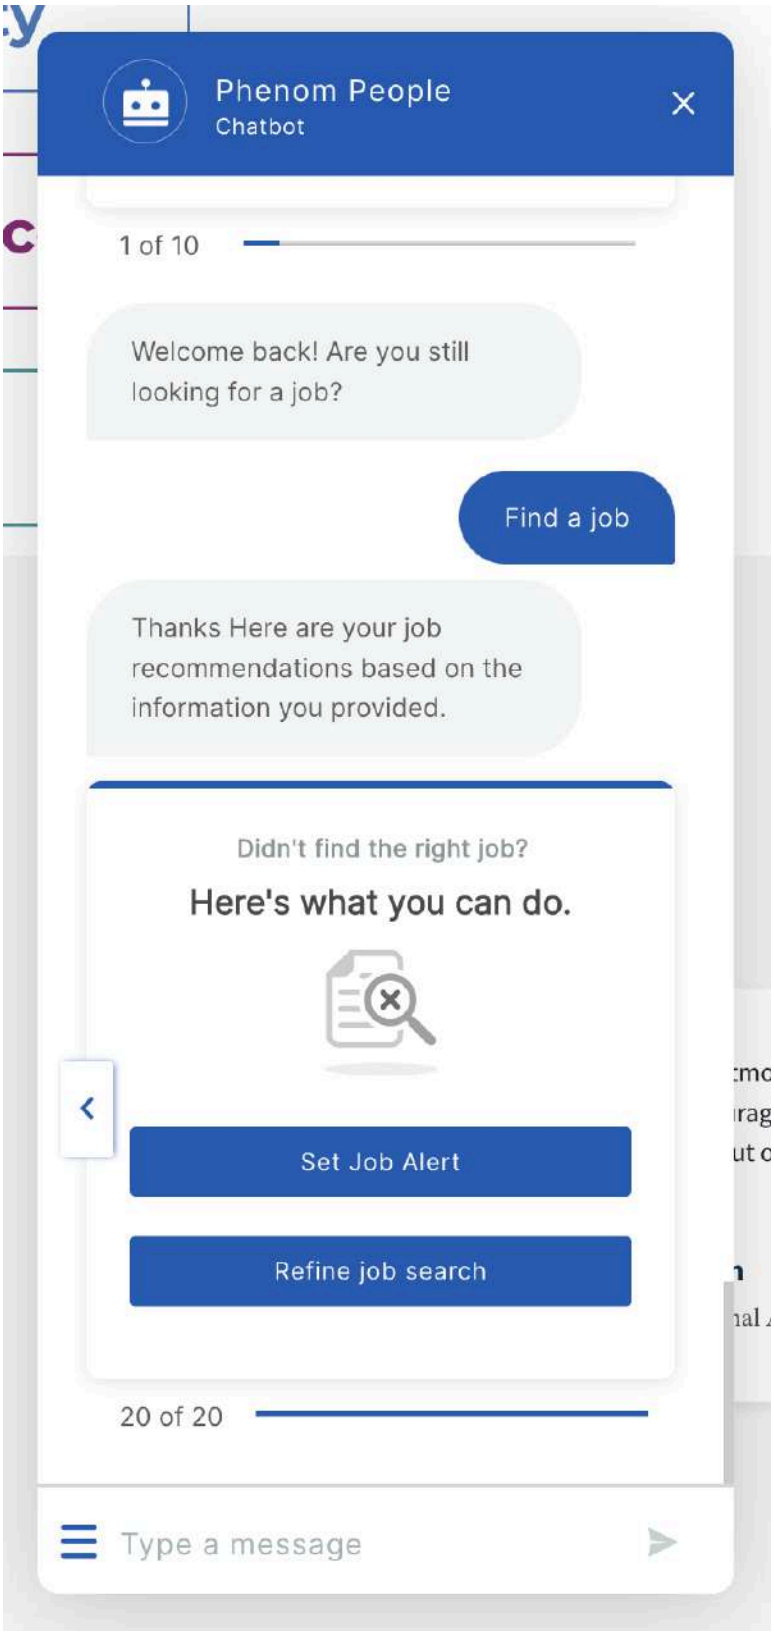
Bot is typing...

4. **Asking FAQs**

5. **Similar job alerts**



Testing, iterations & learnings

1. **Design to get necessary attention**
   In the earlier versions of the chatbot, we wanted the bot to be non-intrusive to the user. So, the bot was just existed on the career site without nudging the users to interact with them. This resulted in just **0.02%** usage of the web traffic. To get better results we made the bot pop-up when users come on the career site. This gave us an average of **upto 7%** of website traffic. Later on, we also added sounds 🔊 to the bot, to improve or user engagement. This gave us a marginal boost.

2. **Too much emphasis frustrates the user**
   Once we had the bot pop-up and had the sound, the bot got the necessary attention. But on opening every page, as candidates scan through the site for jobs, the bot popped-up with a sound. This got annoying and we had to do adjustments to make sure the bot only following this behaviour under certain conditions

3. **Give, give, give and then take**
   In some of the earlier versions of the bot, our focus was lead generation. For this, we made the flow such that users have to give us their details like name, email ID and phone number and then provide them job. To provide better value we went on to tweak the flow, such that we show them the jobs first and then ask for their details, if they are interested. We did this knowing that this might cause a dip in the number of leads created. However, once live, we instead got an increase in the number of leads. And since they we were collecting leads only once they were interested, we could fairly assume that these are better quality leads.
