
4. Chatbot Management Platform

< Back to Home

Once we built the chatbot, we wanted a way to let the customers manage the bot rather than them having to come to our implementation or development team to configure styling, interactions,FAQs etc. For this reason, we wanted to build a platform to manage the bot.

My Responsibility - **UX lead**
Team members - **1 UX designer and 1 UI designer**

Problem

Before we release the bot the customers, if we don't have an interface in place for customers to manage the bot on their career site, there **will be a huge increase in number of support tickets raised**. Moreover, to add the FAQs to the bot, without an interface, **it may take more than 3 weeks,** as usually the talent marketers (our

users) need to spend time collecting all the answers for the questions they want the bot to answer. Increase in onboarding time would mean that a lot of candidates are going unserviced. Also, a lot of customers & our productive time is wasted on this collecting FAQs, configuring bot etc, which would otherwise be simplified.

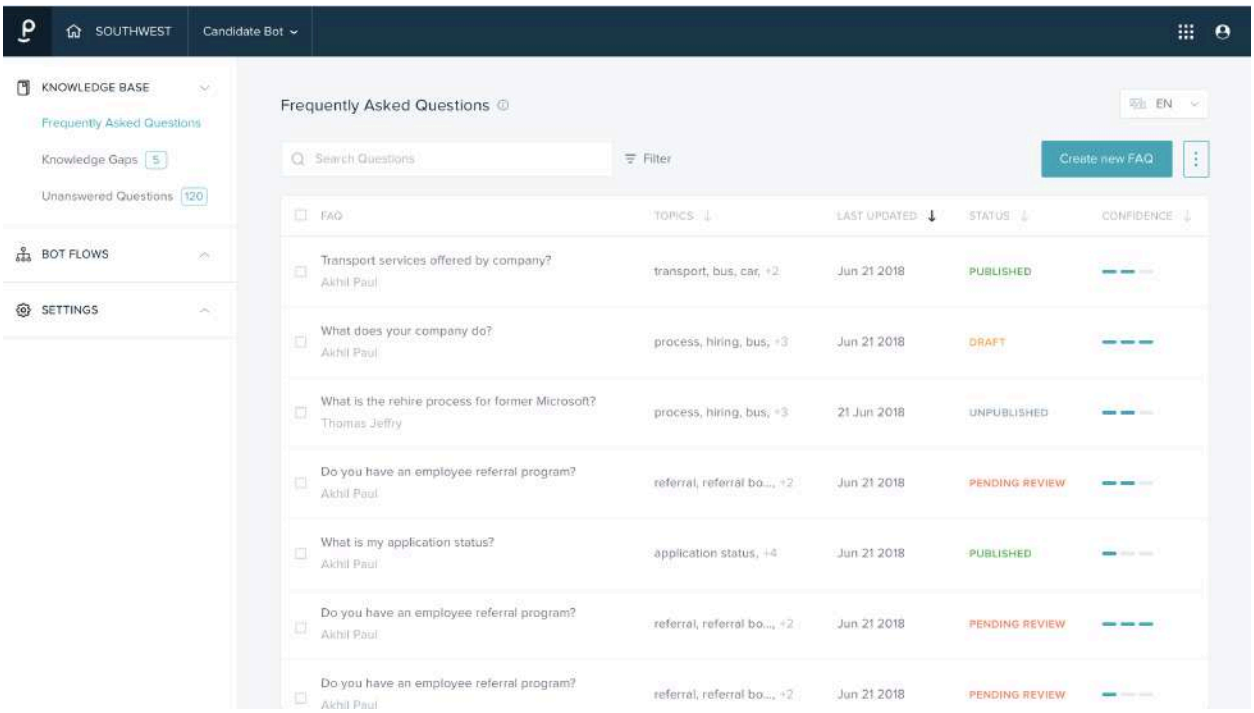
Solution

FAQs

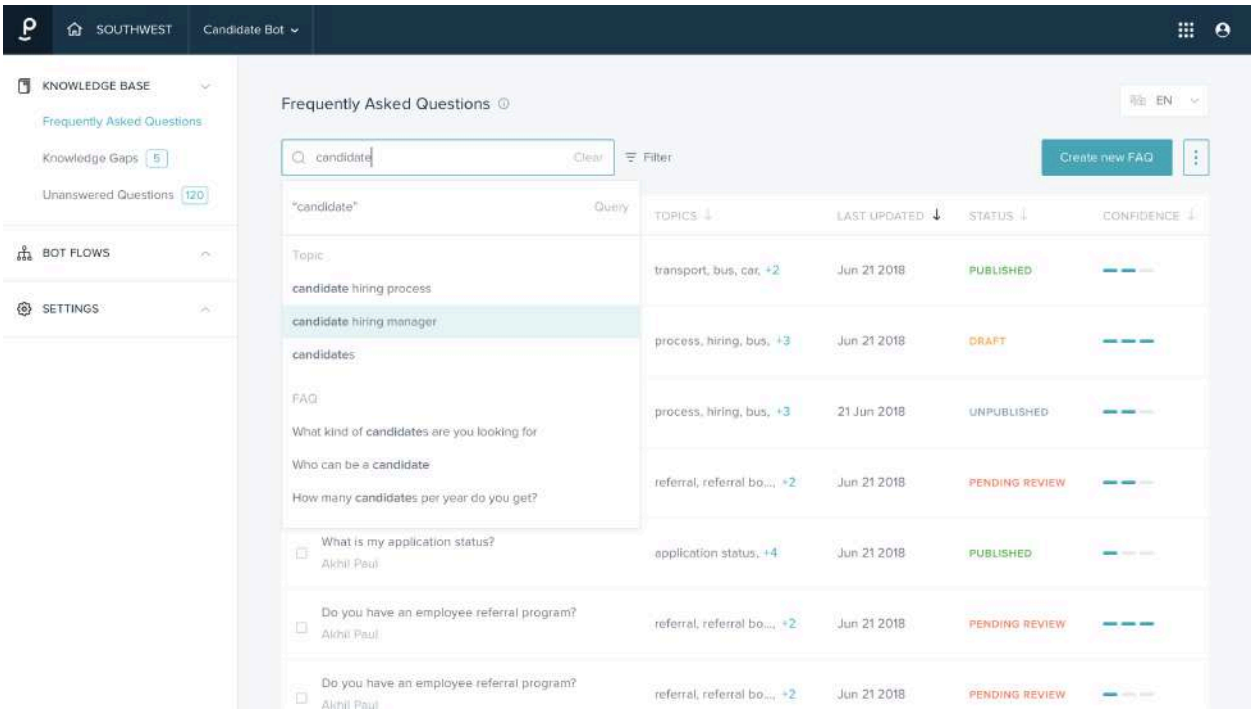
To make it easy for customers to give out question-answer pairs of the ones they want the bot to answer, we designed this section. Some of the key considerations here :-

- Easily navigation between questions
- Recommended answer limit, but not a hard limit
- Training phrases
- Confidence scores for answering FAQs

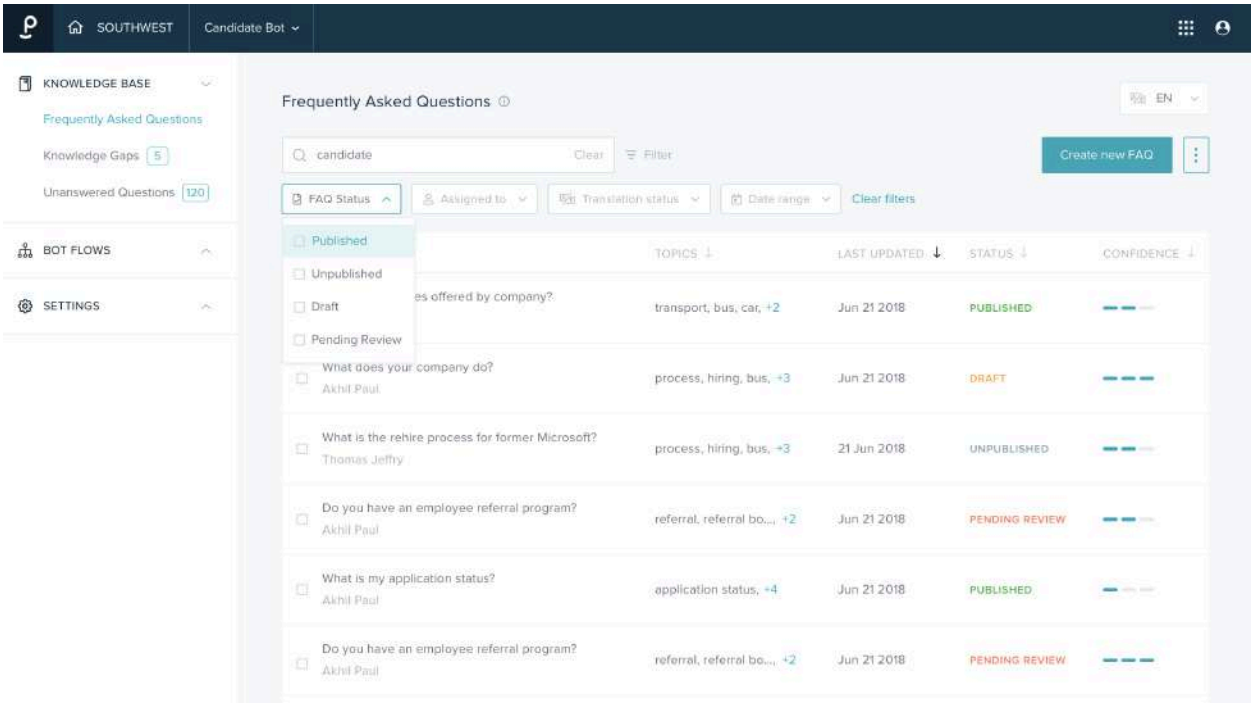
FAQ Section



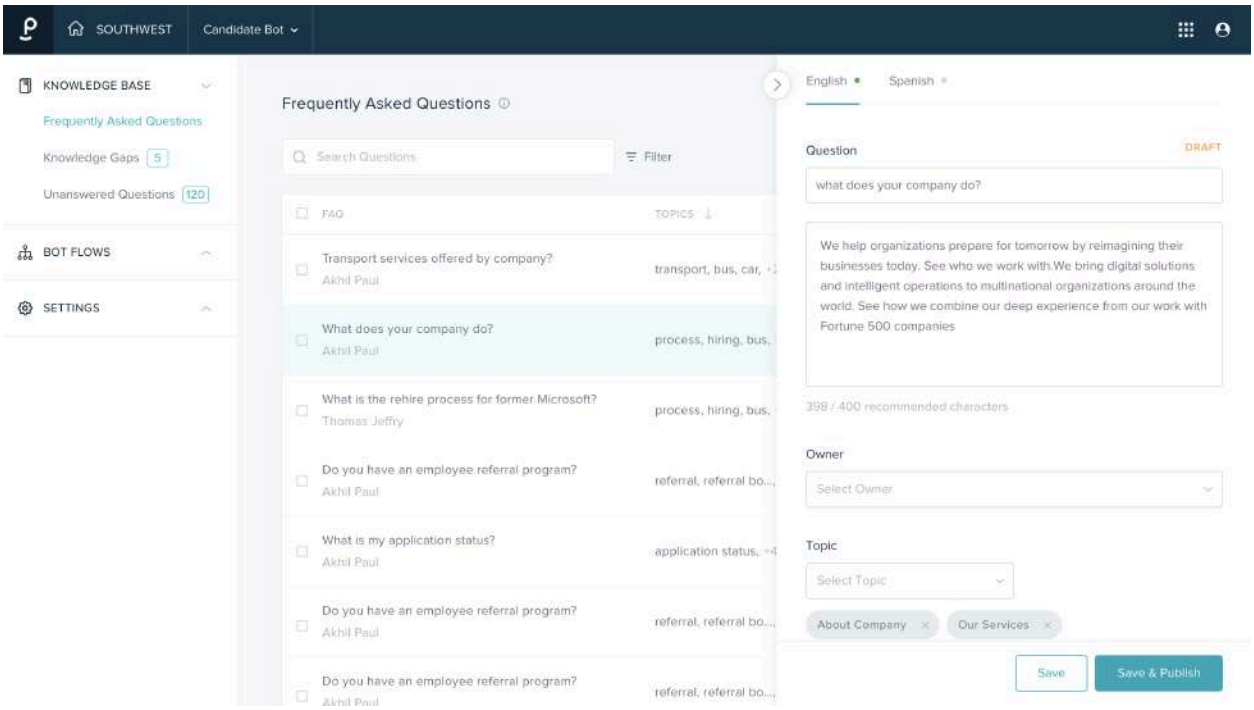
Search behaviour



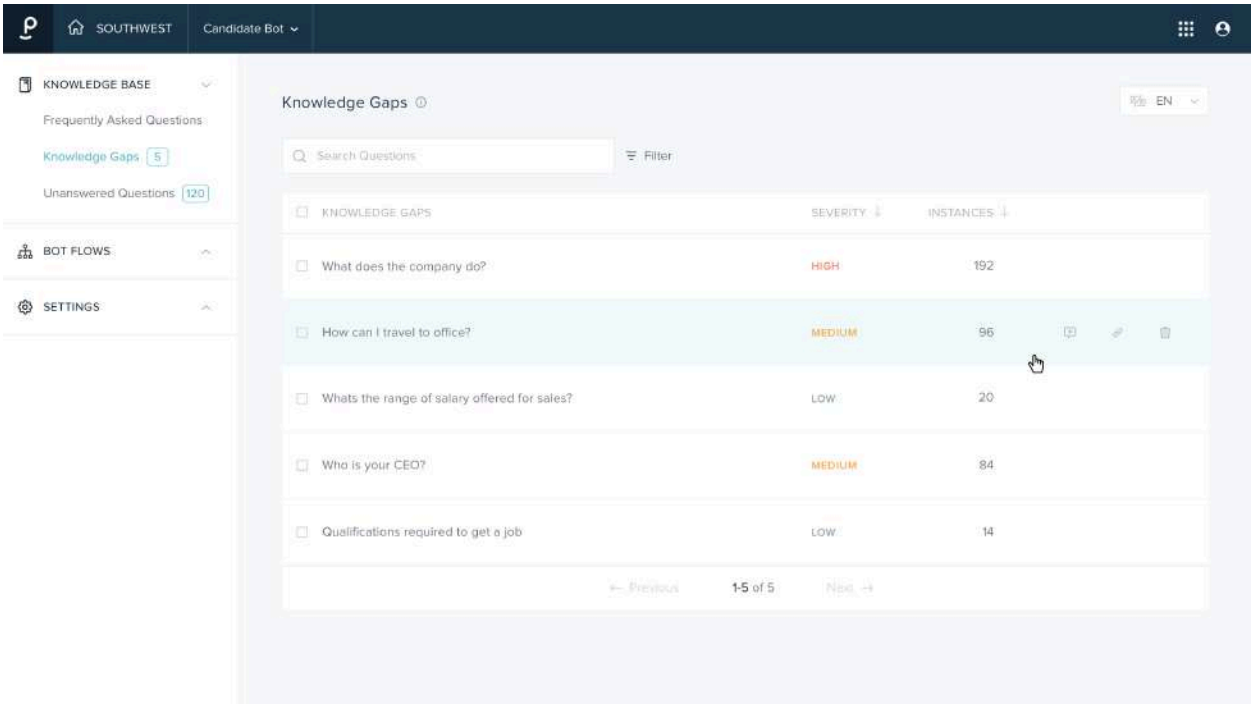
Filters



FAQ sidepanel



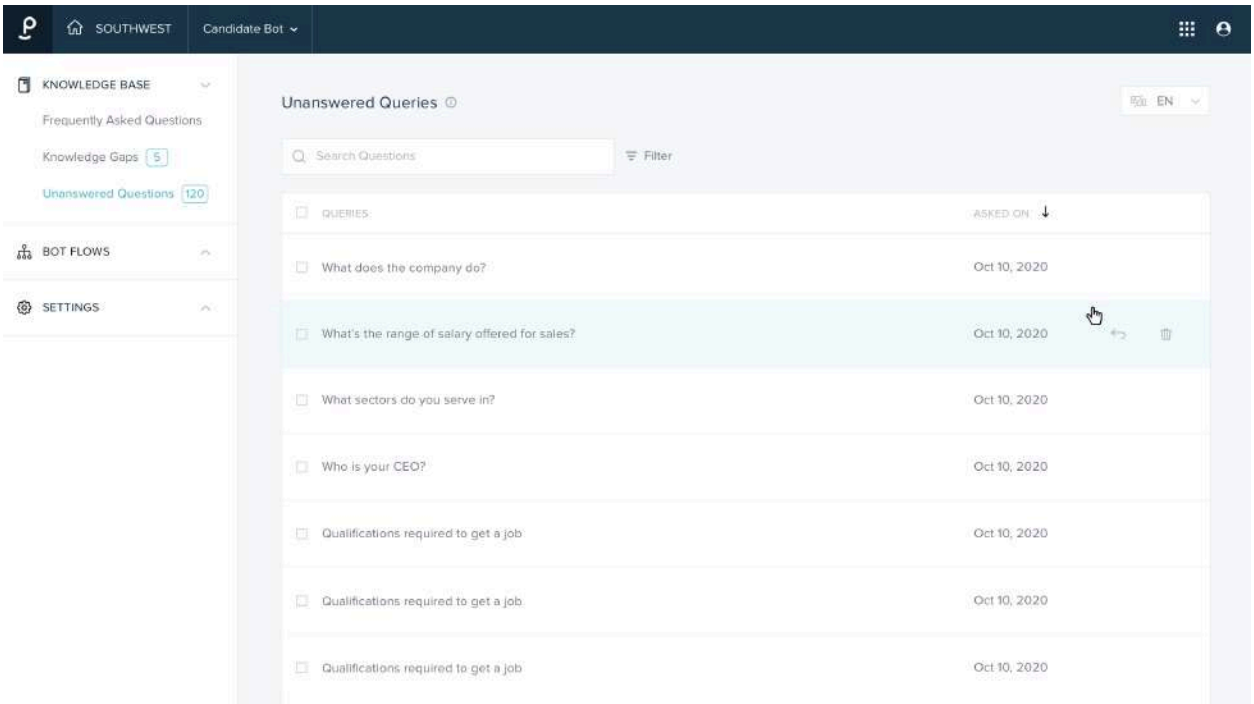
Knowledge Gaps



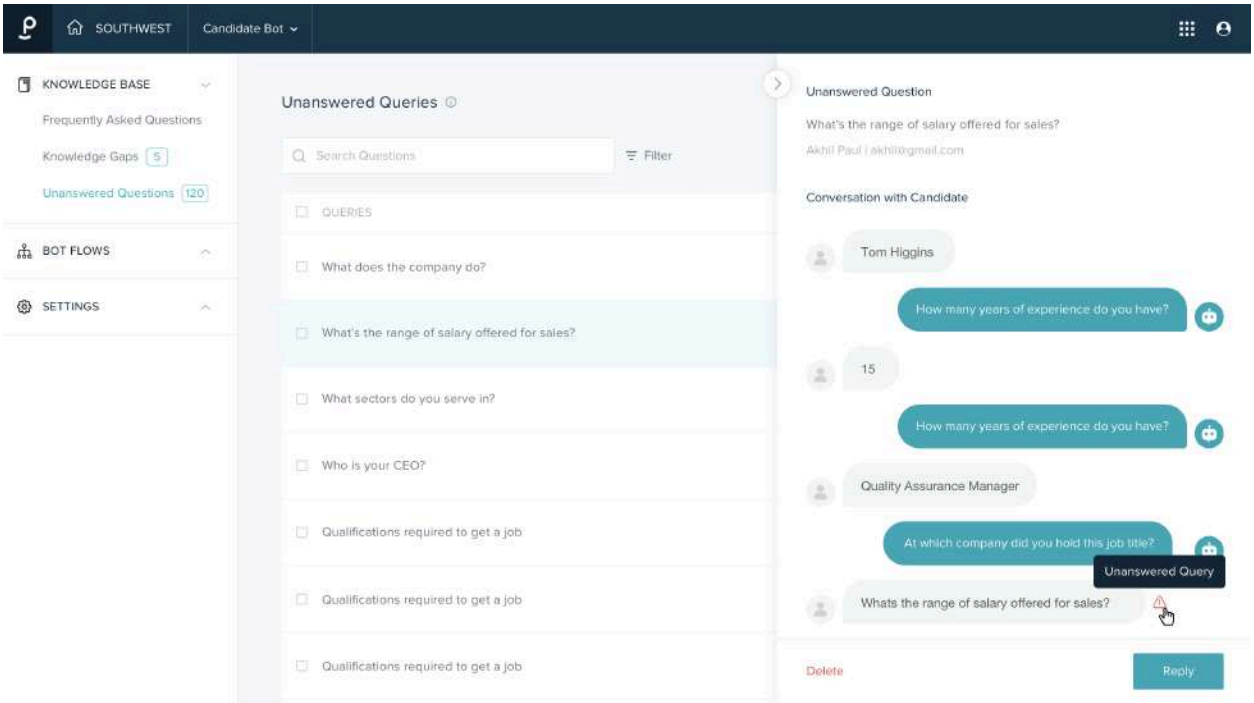
Unanswered questions

Once candidates asks a query on the chatbot, the system tries to understand if its a FAQ or job search. Post that, if FAQ, it tries to point to any of the FAQs in our database with the highest confidence. The cut off for confidence to point to an FAQ is 80%. Below that, the chatbot gives out the fallback answer and stores the unanswered question to show it to our users.Those unanswered questions are stored in this section.

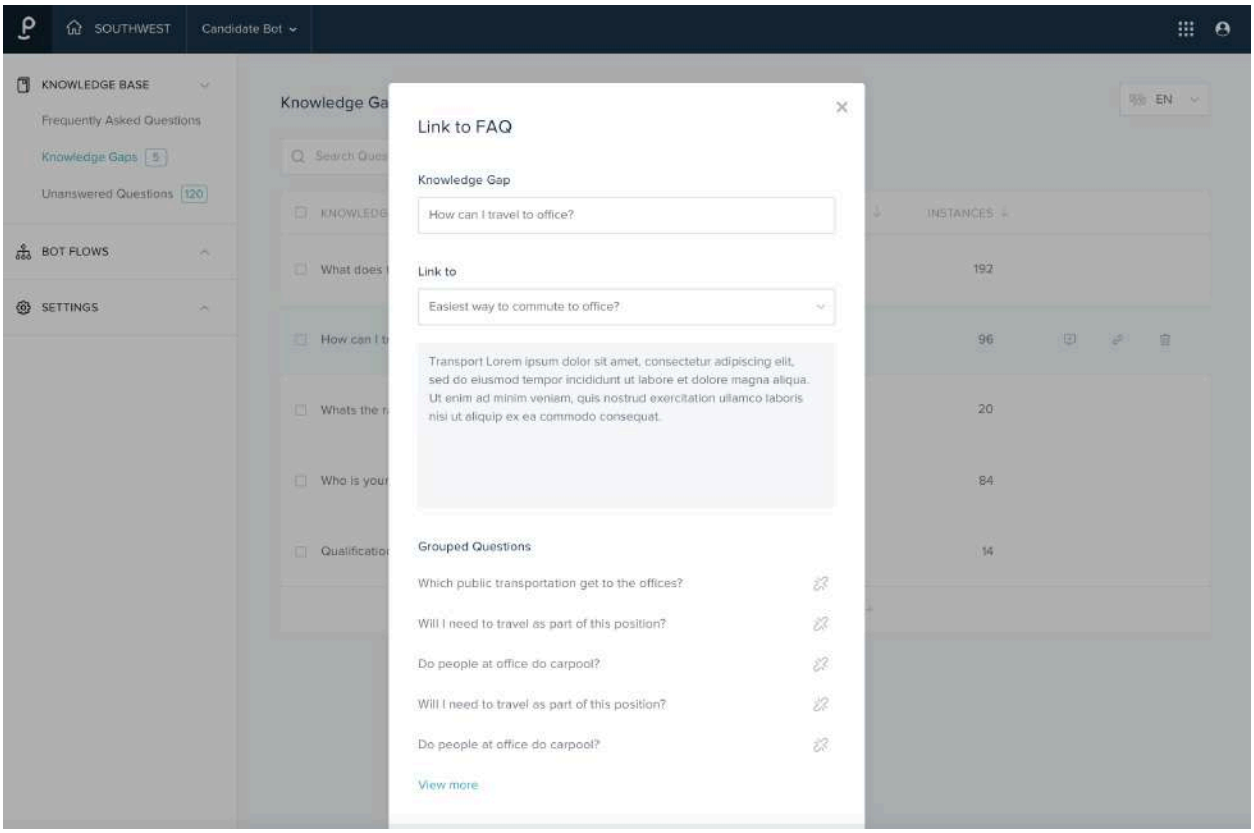
Unanswered questions section



Unanswered query preview



Linking unanswered query to existing FAQ



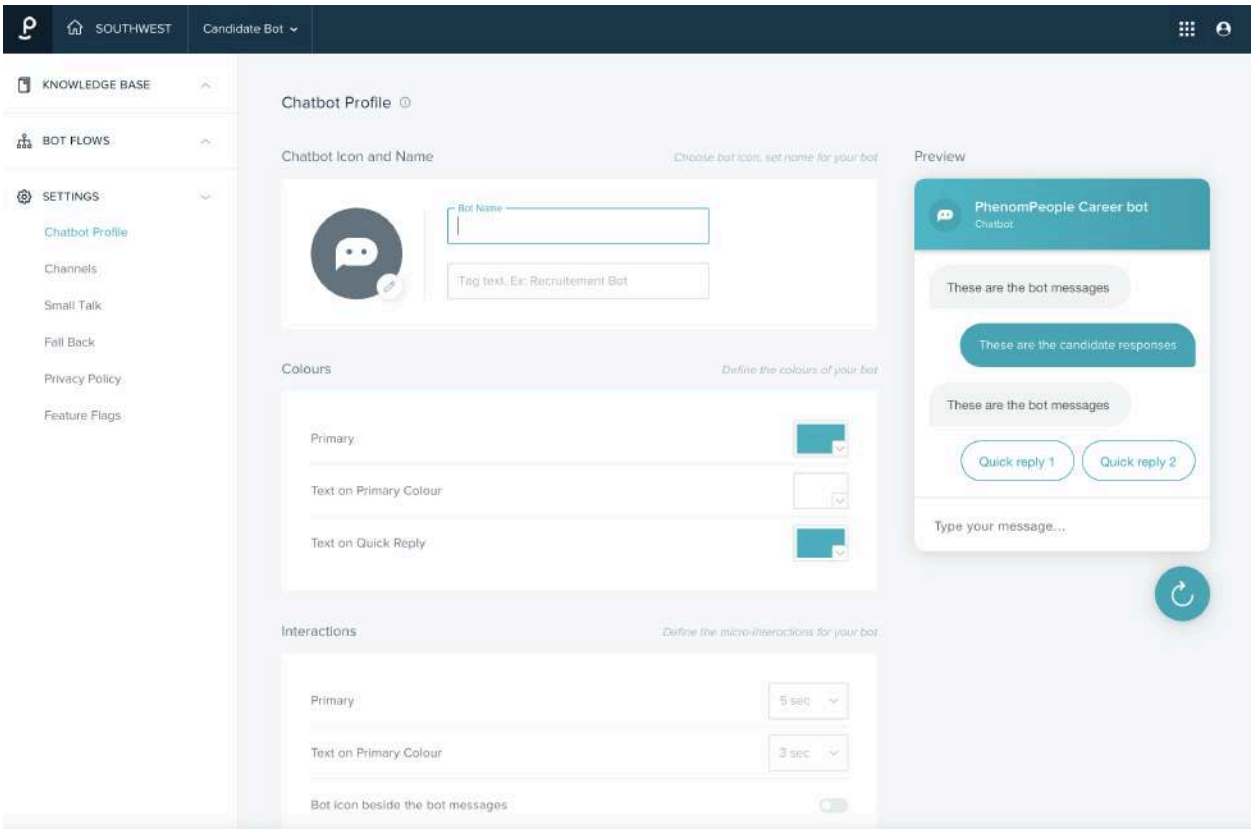
Fall-back answers

These are the answers the bot would give incase its not able to make sense of the candidate's query

Settings

Some of the key considerations here :-

- Being able to choose bot avatar and brand colour
- Able to set bot interactions
- Preview



Learnings

Ability to self service is crucial

As a growing B2B company, we wanted to satisfy our customers but at the same time be able to focus on the larger, roadmap items. As a company philosophy, we moved towards self service, meaning we give enough flexibility for the customers to do their own changes instead of them waiting for weeks to get things resolved. This helps in better implementation & onboarding time and also results in happier customers.
